

**TECHNICAL BULLETIN** 

**1088 - TB** 09-15

1/2" Model 1088

# Application

On many low-pressure storage tanks the operating range is very low, which makes blanketing and venting system selection/design a challenge for the engineer. The Vacu-Gard<sup>®</sup> makes the job much easier. First, the Vacu-Gard<sup>®</sup> set point definition is where the blanketing valve closes bubble tight. This gives the largest dead band between the blanketing valve set point and the set point of the relieving device, and therefore will reduce losses. Second, the Vacu-Gard<sup>®</sup> has a wide range of available settings, from vacuum to 14 psig, that make proper selection easier.

# Model 1088 Vacu-Gard<sup>®</sup> Tank Blanketing Valve 1/2" (DN15)

The Model 1088 is a valve specifically designed for small tank blanketing applications. It opens and closes automatically as required, to maintain a closely controlled blanket pressure. Standard valve material provides added corrosion protection at no additional cost The simple design increases reliability and lowers maintenance cost.

# **FEATURES**

Versatile: Single valve system offers wide variety of configurations to meet every blanketing application. Self cleaning flow design. **Bottom entry** Compact and light weight yet allows complete access to the valve internals Design: without being removed from the tank. Only time the diaphragm case needs to be disassembled is when replacing the diaphragm. Stability: Pressure balanced trim. Fluctuations in supply pressure does not affect set point. Performance: Valve set point can be verified 100% on the tank, without removal and without flowing supply gas into the tank. Temperature changes have no appreciable effect on set point Shutoff: Bubble tight at set point, prevents waste of blanketing gases. Lower Uses standard o-rings for seat and Maintenance seals. Costs:

# **GENERAL SPECIFICATIONS**

## Sizes

1/2" (DN15)

#### Connections

1/2" FNPT (screwed)

1/2" 150# RF threaded flanges & nipples

3/4", 1" 150# RF threaded reducing flanges & nipples

Larger size reducing flanges and special con figurations are available on request: DN15 (PN40) flanges. "Tri-Clamp<sup>®</sup>".

# Outlet Configurations

Horizontal or Vertical

Valves with FNPT or threaded nipple and flange connections can be configured in the field. Special configuration must be specified at time of order placement.

# Sensing Options

Remote sensing Integral dip tube sensing (Vertical Outlet Only) Internal sensing

# **Supply Pressures**

Minimum: 10 psig (.69 Bar) Maximum: 200 psig (13.83 Bar)

## Capacities

**<u>Remote Sensing</u>**: use flow capacity values listed in Table 6.

Internal Sensing: multiply flow capacity values in Table 6 by 25 %.

Pressure - Temperature Specifications							
Body Material	End Connection	Inlet Pressure	Temperature F(C)*				
316	NPT & 300# Flange	200 psig (13.8 Barg)	-50 to 400 (-45 to 204)				
Stainless Steel	150#	200 psig (13.8 Barg)	-325 to 300 (-198 to 149)				
	Flange	195 psig (13.4 Barg)	-325 to 400 (-198 to 204)				
* Design temperature limits maybe restricted by trim selection							

## **Outlet Pressure Ranges**

See Table 3

# Maximum Back Pressures

25 psig (1.7 Bar) – standard Higher pressures on request

## Materials of Construction

Diaphragm Case Material: Carbon Steel (Powder Coated) Stainless Steel Trim Material: 316 SST Diaphragm Material: PTFE Soft Seat & Seals: FKM – standard, Buna-N, EPDM, FFKM 1 - Similar to Chemraz FFKM 2 - Similar to Kalrez

## **Temperature Limits**

Seat & Seal Materials FKM (Fluorocarbon Elastomer): -15° to 300° F (-26° to 149° C) Buna-N (Nitrile-NBR): -40° F to 212° F (-40° C to 100° C) EPDM (Ethylenepropylene): -55° F to 212° F (-48° C to 100° C) FFKM 1 (Perfluoroelastomer): -22° F to 400° F (-30° C to 204° C) FFKM 2 (Perfluoroelastomer): -40° F to 400° F (-40° C to 204° C)

# Paint

<u>Standard</u>: Exterior coating will be a combination of Cashco Paint Specs #S-1777 epoxy and #S-1743 powder coated. Tubing, fasteners, - corrosion resistant parts excluded.

Alternate Paint: See Opt-95OS.

# CAPACITY REQUIREMENTS

The capacity requirement of the tank blanketing valve is the sum of two components. The first being inbreathing due to liquid or product movement out of the tank and the second being inbreathing due to contraction of the vapors/product because of weather changes.

Inbreathing due to maximum liquid or product movement out of the tank equals 8.0 SCFH of air for each US gallon per minute of maximum emptying rate or 0.94 Nm<sup>3</sup>/h of air for each m<sup>3</sup>/h of maximum emptying rate.

# Q displacement (SCFH) = Max. Pumpout Rate (gpm) x 8.0

Or Q displacement (Nm<sup>3</sup>/h) = Max. Pumpout Rate (m<sup>3</sup>/h) x .94 The second component, inbreathing due to weather changes, is selected from Table 5 (Table 5A). The tank capacity is found in column 1 and the corresponding inbreathing requirement is selected from column 2.

The two components are added together to give the total inbreathing requirement and the capacity requirement of the tank blanketing valve.

#### Q total = Q displacement + Q thermal

# **VALVE SELECTION**

If the tank blanketing supply pressure varies, use the minimum supply pressure in selecting the tank blanketing valve and the maximum supply pressure to determine blanketing valve failure capacity. Go to Table 6 to determine the capacity at the minimum supply pressure. This capacity must be equal to or greater than the Total Inbreathing Requirement (Q total).Next determine if a reducing "flow plug" can be used to make the capacity of the tank blanketing valve more closely match the inbreathing requirements. This will also reduce the fail open capacity of the blanketing valve. This is done by dividing the required inbreathing (Q total) by the full capacity of the size valve selected and multiplying by 100. Now from Table 2 choose the flow plug that is greater than the calculated percentage.

#### Example:

Total inbreathing requirement (Q total) = 1,000 SCFH Maximum supply pressure = 100 psig Minimum supply pressure = 80 psig The 1088 flows 1,318 SCFH at 80 psig.

At the maximum supply pressure of 100 psig, use Cv of 1.1 or fail open flow, which is needed when sizing the pressure relieving device.

# **VALVE OPERATION**

The Vacu-Gard Model 1088 is a direct spring-operated pressure reducing valve. Below demonstates the three sensing options available.

Set pressure is defined as the pressure at which the valve will be fully closed on increaseing tank pressure during a normal operating cycle to inject needed blanket gas. Whenever the pressure in the sense chamber falls below the set pressure, the set pressure spring located above the sense diaphragm will push downward to unseat the spindle. This will allow inlet pressure to flow across the spindle seat and out through the outlet port. When the pressure in the sense chamber is sufficient to overcome the force of the set pressure spring the spindle will move upward to close the seat and stop the flow.

The internal sensing valve senses the outlet pressure just downstream of the seat. The flow here is very turbulent. This results in a pressure reading higher than actual tank pressure resulting in reduced flow capacity. This is most noticable at low setpoints.

The integral dip-tube sensing valve senses the tank pressure through the use of a dip-tube that must protude a minimum of 6" below the tank roof. See OPTIONAL FEATURES & ACCESSORIES.

The remote sensing valve senses the tank pressure remotely through the remote sense port.

The sense chamber is not a dead ended chamber. therefore, whenever the valve is open, there is a very small flow from the seat up into the sense chamber. Any pressure that gets into the sense chamber from this path must be able to get out rapidly through the sense port, otherwise, a build up of pressure in the sense chamber will occur, causing the valve to close prematurely. For this reason, remote sense lines and valve discharge piping must be large enough to carry away this pressure.

# Model 1088 Vacu-Gard Tank Blanketing Valve Sensing Options

# **STANDARD INFORMATION**

The tank blanketing valve is not a substitute for the vacuum relief device.

API Standard 2000 states, "The design of a gasrepressuring system to eliminate the requirement for vacuum relief valves is beyond the scope of this standard and should be considered only when the induction of air represents a hazard equal to or greater than failure of the tank".

### The tank blanketing valve failure must be taken into account when considering possible causes of overpressure in a tank.

API Standard 2000 states, "When the possible causes of overpressure or vacuum in a tank are being determined, other circumstances resulting from equipment failures and operating errors must be considered and evaluated by the designer." Failure of the tank blanketing valve can result in unrestricted gas flow into the tank, reduced gas flow or complete loss of the gas flow.

# Tank blanketing valve set point definition is not the same for all manufacturers.

Valve Concepts defines set point as the point where the tank blanketing valve is closed bubble tight!

Some manufacturers define the set point as where the blanketing valve opens and the valve requires a pressure above the set point in order to close completely. Others define set point somewhere in between opening and closing but still the pressure must go above the defined set point in order to close completely.

The following example illustrates Valve Concepts definition of set point. 1088-TB

As can be seen from the illustration, the Vacu-Gard gives the greatest dead band between the blanketing valve set point and the relief vent set point.

FIGURE 2

1/2" 150# RF Flange Vertical Connection with Gauge

1" 150# Reducing Flange Vertical Connection with Filter and Gauge

# 3/4" 150# RF Flange Horizontal Connection

# **OPTIONAL FEATURES & ACCESSORIES**

# **Supply Pressure Gauge**

To provide local indication of supply pressure.

- Standard ABS gauge with carbon steel fitting.
- Stainless gauge with 316 SST fitting.

# **Control Pressure Gauge**

To provide local indication of actual tank pressure.

- Standard Magnehelic<sup>®</sup> gauge with carbon steel fitting.
- Stainless gauge with 316 SST fitting.

# **Purge**

A purge is used to prevent tank vapors from entering into the valve. One Variable Area Flow meter (Rotameter) is used to purge both the sense line and the outlet. The combined flow is 1 - 1.5 SCFH. VCI advises the use of a purge when tank vapors may solidify or crystallize when cooled to ambient temperature.

A purge will also extend the service life of the valve if 316 SST is not compatible with the tank vapors.

• Standard Rotameter used has a 316 SST body with glass tube.

# **PV-Gard Manifold**

The PV-Manifold allows for a very compact installation of a blanketing valve and vent valve on one single tank nozzle. Normally, an installation of this type requires at least three different nozzles; one for the blanketing valve, one for the vent valve, and one for the remote sensing for the blanketing valve. Using the PV-Manifold, only one tank nozzle is required.

# Sense with Dip Tube (patented)

This option provides a sense connection into the tank through the <u>vertical outlet</u> of the valve. This can be useful when no tank connection is available for the standard remote sense.

• The dip tube length should be sized so that it protrudes 6" to 8" below the tank roof into the tank.

- The dip tube diameter is 0.375" (9.52 mm).
- Standard material is 316 SST.

# NOTE: Customer must specify length of Dip Tube .

# Inline Filter

The use of an inline filter is not required for regular blanketing gases. An inline strainer or filter can be provided in case the blanketing gas used is not sufficiently clean.

- Option -40: NACE CONSTRUCTION. Internal wetted portions meet NACE standard MR0175, when exterior of the vent is not directly exposed to a sour gas environment, buried, insulated or otherwise denied direct atmospheric exposure. SST body and Trim - Buna-N or FKM Seat and Seal materials only. NPT or Flanged Connection. (Flanged version requires post-weld stress relieving by heat treating.)
- Option -95OS: OFFSHORE installations. Coating of all exterior surfaces will be per Cashco Paint Specs #S-1777 epoxy. Tubing, fasteners, - corrosion resistant parts excluded. Painting of tubing and fasteners optional upon special request.

#### Model 1088 PRODUCT CODE 09/01/15 **SPRING OPERATED VACU-GARD®**
